

The Bone Ring Technique – Single-stage vertical augmentation with bone rings

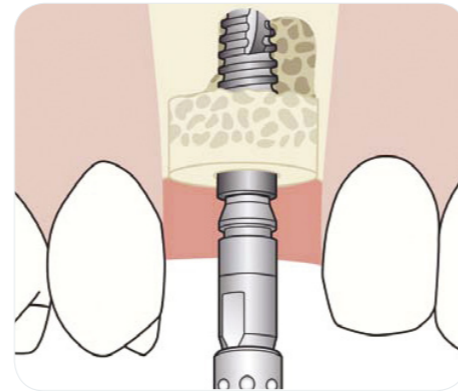

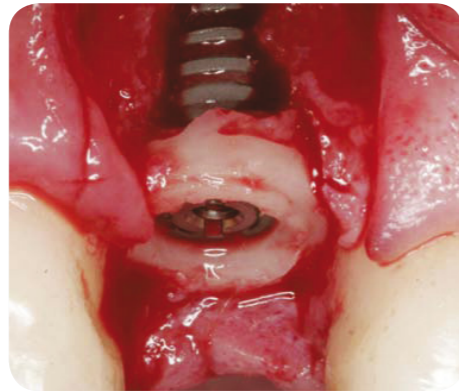

With live surgery and hands-on session

Program

- Theoretical introduction
- Planning the operation
- Step-by-step procedure for bone harvesting, preparation of the recipient site and implant placement
- Soft-tissue management as the basis for restoration of optimum function and esthetics
- Complication management, medication and postoperative care

The course will be held in English language.

The Bone Ring Technique: New perspectives in augmentation

Discover the potential of an alternative grafting Bone Ring Technique that allows bone transplantation and implantation to be performed on large three-dimensional bone defects in a single operation. The technique is applicable for almost all indications, including a sinus lift with minimal bone height. In cases of large bone defects or advanced jaw atrophy, extensive horizontal and/or vertical bone augmentation it is required to prepare the treatment site in two separate stages. The Bone Ring Technique can reduce the total healing phase by about five months compared to classical bone-block grafts. This argument is very convincing for the patients and provides a significant competitive advantage.
